

Electronic Records Management for Ultralite Professional Phototherapy Systems

The EMR Data Module (EDM6809) and NSITE Intelligent Phototherapy Management application are the latest enhancements to Ultralite's professional phototherapy solution.

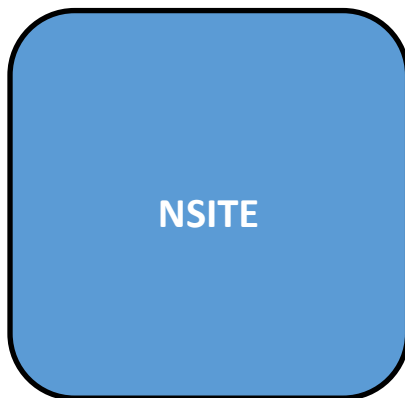

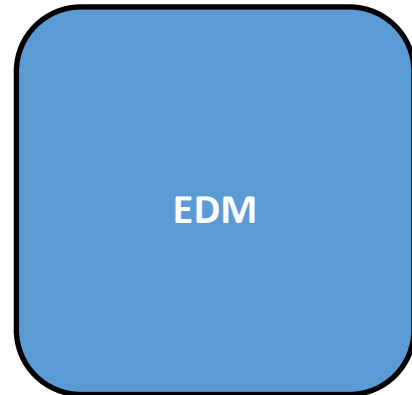

Save Time

Automatically collects treatment session information from the 6809 Controller and creates an electronic record of the treatment session, removing the time-consuming process manually transcribing treatment information to patient files.

Better Compliance Records

Transfer of electronic records to Ultralite's NSITE Intelligent Phototherapy Management application, significantly reduces human error so records become more reliable:

- Removes Transcription Error – Manual transcription is often prone to human error.
- Helps Prevent Lost Records – Treatments are automatically recorded so administrators don't have to remember to record the information.

Improve Your Patients' Treatment

Treatment information recorded by the EMR Data Module can be viewed through the NSITE Intelligent Phototherapy Management application for each patient across any number of phototherapy systems providing you a better view of when, where, and what treatment was administered to the patient.

Electronic Service Logs

Phototherapy system service-related information is captured and recorded enabling the NSITE application to electronically maintain service logs, freeing you from the hassle of paper-based service logs.
